

SPLOST 2017 Stormwater Improvements Draft for Public Comment

CATEGORY I

PROJECT NAME	PROJECT DESCRIPTION	ESTIMATED COST
210 Antebellum Way	Antebellum Way is a one-way in and out street. Excessive pipe damage, due to Christmas Flood event severely impaired stream flow and caused upstream flooding. Double 84 indiameter corrugated metal pipes are bent, restricting flow and are washing out around the inlets. This project includes design and construction to replace with a larger system, possibly box culverts.	\$481,581
104 Broom Blvd	This project will replace an existing 36-inch corrugated metal pipe with double 8' x 5' concrete box culverts. The system and road were damaged during the December 2015 floods. Temporary repairs were made to keep the road open but pipe replacement is needed for structural and capacity issues. Broom Blvd. is the sole access for 13 homes.	\$387,880
Emerald Lake Dam	Emerald Lake Dam is a Georgia Safe Dams Program Category II structure located predominantly within Fayette County Right-of-Way. Work is needed to address flow capacity and structural integrity issues. The project includes design, permitting, and construction of a new labyrinth spillway and associated roadwork. As of January 2016, design work is 80% complete. New cost estimate of \$2,064,000 is based on 20% increase of Engineer's Order of Magnitude estimate. Price increase is due to identification of poor subsoils, which require more excavation and a more complicated traffic management plan.	\$2,064,000
287 Graves Road	Road and shoulder washed out around a 60 in. diameter corrugated metal pipe during the 2015 Christmas floods. The proposed design to address capacity problems is to replace the metal pipe with a 10 ft. X 5 ft. reinforced concrete box culvert.	\$293,538
Heritage Park Way	Heritage Park Way is the only road owned by Fayette County that is located in Fayetteville city limits. This project will replace a failing 60-in diameter corregated metal pipe that connects to stormwater pipe under State Route 85 and a failing 18-in diameter cross pipe that is also part of the system. The proposed design will address flooding issues that routinely occur on Heritage Park Way.	\$98,397
Kozisek Dam	Kozisek Dam is a Safe Dams Program Category I structure adjacent to and possibly partially within the County Right-of-Way for Neely Road. The project includes evaluation, design, permitting, and construction of necessary improvements and changes to Neely Road to ensure it safely passes design flows and to remove any County liability/ownership that may be associated with Kozisek Dam.	\$250,000
413 Lees Mill Rd	During the 2015 Christmas flood event Tar Creek came above and covered three, 72-inch diameter pipes causing excessive damage. This project will consist of evaluation, design and construction to upsize the drainage capacity to allow passage of the 100 year storm event. This project is located in FEMA Zone AE and a large water main is located near the pipes as well.	\$511,849

CATEGORY I

PROJECT NAME	PROJECT DESCRIPTION	ESTIMATED COST
Longview Dam	Longview Dam (AKA Margaret Phillips Lake Dam) is a Safe Dams Program Category I structure located within the Fayette County Right-of-Way of Longview Road. The project consists of performing the necessary evaluation, design, permitting, and construction to bring the structure into compliance with the Georgia Safe Dams Act of 1978. There are two options to do so: upgrade the dam or breach the dam. A 2013 Order of Magnitue cost estimate to upgrade the dam is provided. The preferred option of breaching the dam would be less. However, it is unknown at this time which option will be institued, a estimate of half the cost to upgrade the dam is listed.	\$704,907
330 Oak St	Located in the County portion of Deep Forest subdivision. This project includes performing design, permitting and construction of upgrades to an Oak Street cross-drain to reduce the risk of flooding.	\$78,506
Old Senoia Rd	Three 96 in. diameter corrugated metal pipes draining Perry Creek. Pipe bottoms have failed and washout underneath the road occurred during the Christmas Flooding event. Temporary corrections made to allow both lanes to function. Project includes evaluation, design, environmental permitting and construction of replacement. Evaluation will include possible bridge design. Estimate based on 2013 possible bridge design adding 15 percent for increased costs and flood repair costs incurred by the county.	\$668,572
121 Rising Star Rd	During the December 2015 floods, these two, 72-inch diameter corrugated metal pipes located near the intersection with Brooks-Woolsey Road, were damaged, jeopardizing the integrity of the road and utilities. Temporary measures were taken to reopen the road but pipe replacement is required. This project consists of evaluation, design and construction of an upsized system. The design is complicated by backwater conditions caused by the drainage system under Brooks Woolsey Road.	\$449,143

CATEGORY I

PROJECT NAME	COMPLETED PROJECT DESCRIPTION	Cost
228 Bernhard Rd	Washout around an undersized 36 in. diameter corrugated metal pipe inlet caused shoulder and pipe failure. Temporary repairs measures allows for continued road use but pipe replacement is needed. This projects consists of replacing the current pipe with a42 in. reinforced concrete pipe and headwalls.	\$44,947
Brittany Way	Project completed in 2014. Work included installation of a new 6'x4' box culvert.	\$67,432
105 Canterbury Ln	On Christmas Eve 2015, approximately 60 homes within the Chanticleer Subdivision were without water and had no access to and from their homes when a 72-inch diameter corrugated metal pipe failed, collapsing the road. Emergency pipe replacement was complicated by needing equipment to install a large pipe and the emergency occurring over a holiday weekend. The work is complete.	\$101,636
110 Lawson Ln	Undersized pipes in Northridge Subdivision resulted in flooding of road, lots and several homes along Lawson Lane. This project, completed early 2015, replaced existing pipe and added additional drainage structures.	\$94,509
144 Lowery Rd	Washout around the 54 in. diameter corrugated metal pipe caused shoulder and pipe failure. Temporary measures installed allows for road use. This projects consists of replacing the current pipe with a 60 in. reinforced concrete pipe and headwalls.	\$44,523
456 McBride Rd	Washout around the 54 in. diameter corrugated metal pipe caused complete road failure on McBride Road west of Old Greenville Road. Temporary measures installed allows for road use. This projects consisted of installing a 54 in. reinforced concrete pipe and headwalls.	\$41,820
155 Westbridge Cir	Westbridge Circle is an internal local road within Westbridge Acres subdivision. A tributary to Morning Creek runs through the subdivision and under Westbridge Circle. During the 2015 Christmas and New Years flooding events two-36 in. diameter corrugated metal pipes failed causing immanent road failure. Emergency pipe replacement was required to maintain access to homes located "upstream" of the pipe crossing with no means of ingress or egress other than Westbridge Circle.	\$68,419
	CATEGORY I TOTAL	\$6,451,659

OVERHEAD & PROFIT (15%)			_	\$211,505
SUBTOTAL				\$310,208
Total Estimated Construction Cost Budget				\$1,720,243

The American Association of Cost Engineers recommends dividing engineering construction cost estimates into three basic categories: Order-of-Magnitude, Budget and Definitive Estimates. The Order of Magnitude Estimate is defined as follows:

This is an estimate made without detailed engineering data. Examples are estimate from cost-capacity curves, an estimate using scale-up or scale-down factors and an approximate ratio estimate. This type of estimate would be accurate within +50 percent to -30 percent.

COST ESTIMATE REVISION BY FAYETTE COUNTY

Order-of-Magnitude Construction Estimate from Walden, Ashworth and Associates Inc. \$1,720,243 Further excavation and more complicated traffic management - (+20%) \$343,757

TOTAL \$2,064,000

Where Quality Is A Lifestyle

RE: Emerald Lake Dam – Options for Repair Update

Background

Emerald Lake Dam in the Woodlands Subdivision is classified by the Georgia Safe Dams Program as a Category 2 structure. It is approximately 600 feet long and impounds a 20-acre lake. Emerald Lake Drive is located on top of the dam and is the only means of ingress and egress for the 90+ homes within the subdivision. Fayette County owns and operates the dam.

Significant work is needed on the dam in a timely manner. The most pressing issue is active and on-going seepage erosion around the dam's principal spillway. Repair work is needed on these pipes immediately. Other maintenance and repair items include, but are not limited to: removal of vegetation, control of seepage, outlet stabilization, repair of riser pipe, and extension of the dam's back slope.

A long-term consideration is the future classification of the dam by the Georgia Safe Dams Program. County staff, third-party engineers, and the Safe Dams Program all believe a reclassification to Category 1 standards is likely. If this occurs, Fayette County would have to:

- Upgrade the dam;
- Breach the dam;
- Modify the dam to remove the downstream flood risk; or
- Remove or modify the downstream structures at risk.

Fayette County authorized Walden, Ashworth & Associates to serve as the "Engineer of Record" for this project and develop options for County review. Their findings are summarized below.

Findings

Walden collected field data from the dam and surrounding land, including a geotechnical investigation. They also reviewed the project's records and ran hydrology and hydraulic models for the watershed and outlet controls. Their work confirmed that the existing structure is

Mailing Address: 140 Stonewall Avenue West Main Phone: 770-460-5730 Web Site: www.fayettecounty ga.gov

designed to pass flows associated with the 24-hour, 10-year storm event. Larger storms will result in the dam being overtopped. That is, during any year, there is less than a 10 percent chance that the road will be overtopped and access limited (or prohibited) into and out of the subdivision.

Ultimately, four options were identified and an Order-of-Magnitude estimate was developed for each. Staff reviewed these options and narrowed the list to two alternatives.

Slip-line Existing Pipes & Install a Seepage Drain — This option addresses the immediate repair and maintenance needs of the dam. It includes clearing and grubbing, draining the lake, water control, slip-lining the five 80-ft long corrugated metal pipes (48" diameter each), pressure grouting around the pipes, installation of a new riser pipe, installation of comprehensive drain system, and stabilization. The estimated construction cost for this work is \$694,000.

Advantages of this option include a substantially lower cost, resolution of immediate structural issues, and minimal impacts to traffic during construction. This option, however, does not improve the hydraulic capacity of the dam; so the probability of the road being overtopped remains as it currently is. Furthermore, the work associated with slip-lining the pipes (approximately 25% of the total project cost) plus some of the grading, stabilization and other tasks would have to be modified or replaced if the dam is classified as a Category 1 structure in the future.

40-ft Labyrinth Weir & Raise Dam – This option also addresses the immediate repair and maintenance needs of the dam plus substantially increases the hydraulic capacity of the structure. Work items include: clearing & grubbing; draining the lake; water control; demolition of roadway, pipes, and concrete weir; construction of 40-ft labyrinth weir; placement of bridge over weir; roadway reconstruction; installation of a new riser pipe; installation of comprehensive drain system; and stabilization.

This option address immediate structural issues and substantially increases flow capacity of the dam. The new outlet control would be designed to meet Category 1 standards so no re-work of the outlet control and spillway is anticipated. This option also reduces the chance of road overtopping to less than 1 percent per year.

The original estimated construction cost for this work was \$1,720,000. The weir, bridge and road reconstruction account for over \$900,000. Further engineering design work has identified poor subsoils which will result in more excavation and a more complicated traffic management plan. Because of these issues a new estimate based on a 20 percent increase of the Engineer's Order of Magnitude estimate is advised. This increases the estimated cost from \$1,720,243 to an estimated \$2,064,000.

Recommendation

Staff recommends the 40-ft labyrinth weir option. Although nearly 2.5 times the cost this options provides the triple benefit of 1) repairing immediate needs; 2) reducing the probability of stranding homeowners during flood events; and 3) meeting Category 1 standards should they become applicable.

Neely Road / Lake Kozisek Dam - Order of Magnitude Opinion of Cost

Kozisek Dam is a Safe Dams Program Category I structure adjacent to and possibly partially within Fayette County Right-of-Way for Neely Road. The project includes evaluation, design, permitting, and construction of necessary improvements and changes to Neely Road to ensure it safely passes design flows and to remove any County liability/ownership that may be associated with Kozisek Dam.

This is an Order of Magnitude Opinion of Cost and based solely on a visual inspection of the dam. No survey measurements, geotechnical evaluations, hydrologic or hydraulic analyses, material testing or other calculations were made in support of the Opinion of Cost other than the assumptions identified below.

A third-party Engineer was hired to develop the Opinion of Cost for the other two Dam projects included in the SPLOST list. The estimate for the Neely Road / Lake Kozisek Dam work was developed by County staff because of the greater uncertainty associated with the scope of this project. Several options are available for bringing this structure into compliance and the County's degree of involvement may change depending upon the final option selected.

The Kozisek Lake Dam is approximately 1,004 feet long, 26 feet in height and has a crest width of 12 feet. The drainage area to the dam is 430 acres (+/-).

Neely Road / Lake Kozisek Dam - Order of Magnitude Opinion of Cost

Description	Quantity	Units	Unit Price	Cost
Professional Services				
Surveying for Design				\$8,000
Geotechnical Exploration				\$5,000
Design and Preparation of Construction Documents				\$30,000
Preconstruction Notification (PCN) to USACOE				\$3,000
State Waters Buffer Encroachment Variance Application				\$1,000
Construction Administration Services ¹				\$7,000
Geotechnical Construction Monitoring ¹				\$10,000
Assumes two month construction monitoring				•
Subtota Construction Activities	I			\$64,000
Mobilization	1	LS	\$10,000	\$10,000
Traffic Control	1	LS	\$7,500	\$7,500
Erosion Control / Pollution Prevention	1	LS	\$8,000	\$8,000
Clearing & Grubbing	8.0	AC	\$5,000	\$4,000
Control of Water	1	LS	\$2,000	\$2,000
Concrete cross-drains under Neely Road	80	LF	\$315	\$25,200
Concrete Headwalls	2	EA	\$2,500	\$5,000
Earthwork	588	CY	\$15	\$8,820
Grassing	3872	SY	\$3	\$9,680
Rip Rap	250	TN	\$80	\$20,000
Paving	830	SY	\$60	\$49,800
Subtota	I			\$150,000
General Conditions (7%)				\$10,500
Overhead & Profit (7%)				\$10,500
(Overhead & Profit reduced from 15% since County expected to pe	rform substantial	amount of wo	ork in right-of-way	y)
Contingency (10%)				\$15,000
Subtota	I			\$36,000
Total Project Cost				\$250,000

Assumptions:

- 1. Clearing limits based on 60-ft road right-of-way, less existing asphalt.
- 2. Cross-drain costs based on twin 6' x 6' box culverts. Actual size to be determined.
- 3. Earthwork assumes average depth of 2 feet, with 4:1 side slopes.
- 4. "Paving" include demolition, base preparation, GAB, hauling and asphalt placement, etc.

General Information				
Project ID				
Street Name	Lees Mill Rd			
Site Visit Date	1/20/2016			
Road Classification	Rural			

Project Notes

Culvert replacement alternatives to provide flow capacity for the 100 year storm peak runoff.

Field Notes			
Design (Existing Site Features)			
Existing Road Laneage	2-12'		
Existing ShId Width (paved and grass) (feet)			
Existing Side Slopes			
Existing Guardrail	No		
Depth fm Pavement to Top of Culvert (ft):	(+/-) 5.2'		
Pipe Type and Size	3 - 72" CMP		
Pipe Condition (1-5) (1 is new) 5			
Condition Notes: Existing culverts do not provide service for the 100			

Pavement Type/Condition Asphalt/Good

Environmental Features

RE: Longview Dam (a.k.a. Margaret Phillips Lake Dam) Update

Background

Longview Dam (a.k.a. Margaret Phillips Lake Dam) is classified by the Georgia Safe Dams Program as a Category 1 structure. Under the authority of the Safe Dam Act, the Georgia Safe Dams Program maintains an inventory and classification system of all the dams in the state. They also establish minimum design and maintenance standards for Category I (high hazard) structures through inspection and permitting.

This dam is approximately 16-feet high, 670 feet long, has a top width of 20 feet, and impounds a 16-acre lake. Longview Road runs across the top of the dam. Fayette County owns and operates the dam. In order to meet Georgia Safe Dams Program requirements, Fayette County shall either:

- Upgrade the dam;
- Breach the dam;
- Modify the dam to remove the downstream flood risk; or
- Remove or modify the downstream structures at risk.

Of these four options, upgrading the dam and breaching the dam are the most practical options.

Fayette County authorized Walden, Ashworth & Associates to serve as the "Engineer of Record" for this project to develop upgrade and dam breach options for County review (attached). A summary follows.

Option I - Dam Upgrade

Walden reviewed all the Safe Dams Programs files on Longview Dam and performed a field inspection. They did not perform a detailed hydrological and hydraulic evaluation because of cost constraints. The inspection confirmed that significant work is needed to bring this dam up to Category I standards. Noted concerns include: slope stability since the toe of the dam is chronically wet, the presence of longitudinal cracks along the road, and severe erosion around the main drain pipe. Maintenance and repair work includes: removing vegetation, flattening slopes to a 3:1 (or flatter); and installing a seepage collection and removal system.

Based on previous experience and taking into consideration both the drainage basin and lake size, Walden assumed that a 20-foot wide labyrinth weir would be required for outlet control of the improved dam. An outlet structure of this size requires a bridge for the road and underground utilities would have to be relocated.

The Consultant's order-of-magnitude cost estimate for the Dam Upgrade option is \$1,409,815. This includes design and construction but excludes acquisition costs for approximately 40,000 square feet of new right-of-way and easements.

Option 2 - Dam Breach

The dam breach option returns the watershed to free-flow (i.e., natural) conditions by draining the lake and cutting out a portion of the dam. The Option also calls for Longview Road to be permanently cut/broken, thereby avoiding the cost of a new culvert or bridge. Instead, cul-de-sacs will be provided on either side of the breach location to provide turn-around points for Longview Road. Work to breach Longview Dam includes:

- Environmental permitting;
- Acquiring proposed right-of-way and easements for the project.
- Draining the lake;
- Breaching the dam with a 20-ft cut and 4:1 side slopes;
- Breaking of Longview Road and installation of two cul-de-sacs;
- Installation of guard rail; and
- Installation of a drain pipe and concrete weir wall for control of peak flows.

Breaching the dam removes the dam from any further operations and maintenance requirements by the Georgia Safe Dams Act. For a conceptual cost estimate, County staff assumed the Dam Breach option would be \$704, 907, one-half the estimated amount to upgrade the dam. Similar to Option 1, this excludes right-of-way and easement costs.

Recommendation

Staff recommends Option 2, Dam Breach. This option provides the double benefit of 1) meeting the required Ga Safe Dams Act Category I standards and 2) removing the structure from future State operation and maintenance requirements. Although Longview Road is a Collector, it lends itself to be changed from a thru road to a deadend road since there are alternate roads (i.e., SR 314) providing the same connectivity.

Direction is needed from the Board of Commissioners regarding which option to pursue. Further design and permitting is on hold until guidance is provided.

COST ESTIMATES FOR LONGVIEW DAM TO MEET GEORGIA SAFE DAMS CATEGORY 1 REQUIREMENTS

Option 1 – Dam Upgrade: \$1,409,815

Option 2 – Dam Breach (preferred): \$704,907

RE: MARGARET PHILLIPS LAKE DAM FAYETTE COUNTY, GEORGIA ORDER OF MAGNITUDE - OPINION OF COST WA&A J.O. 3301700

Dear Mr. Mallon:

We have completed our Order of Magnitude Opinion of Cost for the Margaret Phillips Lake Dam and are pleased to present the results in the attached report. We appreciate the opportunity to assist Fayette County on this project.

If you have any questions, please do not hesitate to call.

Very truly yours,

MARGARET PHILLIPS LAKE DAM FAYETTE COUNTY, GEORGIA ORDER OF MAGNITUDE COST ESTIMATE

INTRODUCTION

This report, which was authorized through an agreement with the Fayette County Board of Commissioners, provides an Order of Magnitude Opinion of Cost for the rehabilitation of the Margaret Phillips Lake Dam and includes a summary of the assumptions and procedures used to develop that Opinion of Cost.

SCOPE

Our Order of Magnitude Opinion of Cost to rehabilitate the Margaret Phillips Lake Dam and bring it into compliance with current requirements for Category I, high hazard dams is based on a brief visual inspection of the dam, a review of available data and our experience with similar dams. The visual inspection was made without the benefit of surveying equipment and no measurements were taken. The scope of the site visit was limited to visible elements only and excluded covered, buried, or hidden conditions. The scope of work did not include any calculations, special investigations, equipment testing, field or laboratory testing, geotechnical investigations or material testing.

<u>DATA SEARCH - GEORGIA SAFE DAMS PROGRAM FILES</u>

The purpose of the Georgia Safe Dams Act, 1977, is to protect the health, safety and welfare of all citizens of the state by reducing the risk of dam failure, thus reducing the risk of death and injury. Under the authority of the Safe Dam Act, the Georgia Safe Dams Program maintains an inventory and classification system of all the dams in the state, an inspection and permitting system, and sets certain minimum design standards for those dams that are considered to be Category I (high hazard) structures.

The Safe Dams Program maintains a file of all known data, inspection reports, correspondence and permitted improvements to all Category I dams. Because the Margaret Phillips Dam is classified as a Category I structure, the Safe Dams Program maintains such a file for it. As part of the scope of work, we reviewed the file for the dam at the office of the Safe Dams Program.

DESCRIPTION OF DAM

The Margaret Phillips Lake Dam is an estimated 670 feet long and has a top width of 20 feet. The dam is approximately 16 feet high and impounds a lake having a surface of approximately 16 acres at normal pool with a drainage basin of approximately 860 acres (1.3 sq. mi.). The normal pool elevation of the lake is controlled by a Corrugated Metal Pipe (CMP) riser located near the center of the dam. The secondary spillway consists of two 24 inch diameter reinforced concrete culverts under the road on top of the dam.

ASSUMPTIONS USED IN OPINION OF COST

Our Opinion of Cost assumes that all of the deficiencies noted by the Georgia Safe Dams Program and our brief inspection will be addressed in the renovation of the dam and will include such items as removal of inappropriate vegetation on both the upstream and downstream slopes; flattening of both slopes to a 3:1 slope; installation of a seepage collection and removal system including a full height chimney/blanket drain and toe drain and additional spillway capacity.

It is not possible to determine the adequacy of the capacity of the spillways without a detailed hydrological and hydraulic evaluation. Such an evaluation is beyond the scope of this Order of Magnitude estimate. Therefore, based on the size of the lake and its drainage basin, we have assumed that a 20 foot wide labyrinth weir type structure will be required. It is important to understand that a more detailed engineering evaluation will be required before a more refined opinion of cost can be developed.

The construction of the labyrinth weir spillway will require the excavation of a section completely through the dam. The rectangular concrete spillway structure will be constructed along with the appropriate seepage control drains in this excavated notch in the dam and select fill will be backfilled against the structure. In order to maintain the roadway, a bridge spanning across the spillway structure will be required. The water line will be suspended under the bridge.

Using criteria established by the Georgia Safe Dams Program, the structure will have a design storm of 25% of the Probable Maxim Precipitation (PMP) based on Antecedent Moisture Condition III (AMC III) which reflects a saturated watershed from antecedent rains. This condition results in the highest runoff potential.

EASEMENTS

The work required to rehabilitate the Margaret Phillips Lake Dam will include construction of a seepage control system and flattening of the downstream slope. To accomplish this work will require construction that will be outside of the right of way and, therefore, on property owned by others. Before this work can be done, property and/or easements must be obtained from the individual property owners affected. It is important to note that the final amount of property owned by others that will be impacted cannot be determined until the final design has been completed. The cost for obtaining this property and/or easements has not been included in the Order of Magnitude Opinion of Cost.

Based on our very preliminary evaluation, the following parcels will be impacted by the areas indicated.

PARCELS IMPACTED

PARCEL NO.	AREA IMPACTED (SQ FT)
0544-037	16,000
0544-121	17,000
0544-0008a	8,700

APPENDIX

A copy of the letter from the Georgia Safe Dams Program outlining the items they have identified that must be addressed to bring the dam into compliance with Category I standards can be found in the appendix of this report.

MARGARET PHILLIPS LAKE DAM FAYETTE COUNTY, GEORGIA ORDER OF MAGNITUDE OPINION OF COST

Our Opinion of Cost is based on limited data and does not have the benefit of detailed design and/or drawings. We have made assumptions based on our observations, available data and our experience with similar dams. A more definitive cost estimate cannot be prepared without detailed design.

The American Association of Cost Engineers recommends dividing engineering construction cost estimates into three basic categories as follows:

Order of Magnitude Estimate

This is an estimate made without detailed engineering data. Some examples would be an estimate from cost-capacity curves, an estimate using scale-up or scale-down factors and an approximate ratio estimate.

Budget Estimate

Budget in this case applies to the owner's budget and not to the budget as a project control document. A budget estimate is prepared using flow-sheets, layouts and equipment details.

Definitive Estimate

As the name implies, this is an estimate prepared from very defined engineering data. As a minimum, the data must include fairly complete plans and elevations, piping and instrumentation diagrams, one-line electrical diagrams, equipment data sheets and quotations, structural sketches, soil data and sketches of major foundations, building sketches and a complete set of specifications. The "maximum" definitive estimate would be made from "Approved for Construction" drawings and specifications.

The construction cost estimate for the rehabilitation of this dam is an Order of Magnitude estimate.

The following is a breakdown of the expected cost for the rehabilitation of the Margaret Phillips Lake Dam. The Opinion of Cost presented here is an Order of Magnitude estimate based on a Category I classification of the dam by the Georgia Department of Natural Resources, Safe Dams Program. On the following page is a breakdown of the Order of Magnitude Opinion of Construction Cost.

The American Association of Cost Engineers recommends dividing engineering construction cost estimates into three basic categories: Order-of-Magnitude, Budget and Definitive Estimates. The Order of Magnitude Estimate is defined as follows:

This is an Estimate is made without detailed engineering data. Some examples would be an estimate from cost-capacity curves, an estimate using scale-up or scale-down factors and an approximate ratio estimate.

Georgia Departn at of Natural Resources Environmental Protection Division

Safe Dams Program 4244 International Parkway, Suite 110 Atlanta, Georgia 30354

Linda MacGregor, P.E., Branch Chief (404) 362-2678

November 5, 2012

FILE COPY

The Honorable Herb Frady, Chairman Fayette County Board of Commissioners 140 Stonewall Avenue West Suite 100 Fayetteville, Georgia 30214

SUBJECT:

Margaret Phillips Lake Dam

Fayette County

Dear Chairman Frady:

As we previously informed Fayette County by letter dated May 13, 2009, the subject dam has been determined to be within the jurisdiction of the 1978 Georgia Safe Dams Act (Act) by virtue of its hazard classification. A detailed visual inspection of the dam, as is also provided for by the Act, has now been performed by the Environmental Protection Division (Division). Copies of the Visual Inspection Report are enclosed. The inspection revealed that the dam does not comply with certain paragraphs of the Rules for Dam Safety (Rules), specifically the following items from Section 391-3-8-.09:

- 1. Paragraph (3)(a) Stability "The design and/or evaluation of new and existing dams shall conform to accepted practices of engineering profession and dam safety industry." Based on standard engineering practice, the downstream slope of the dam is steep and the toe of the dam is wet, which may affect the stability of the dam. There are longitudinal cracks along the road on the crest of the dam with slight displacement towards the downstream edge of the pavement. This may be a stability concern and needs investigation.
- 2. Paragraph (3) (d) The dam shall have a means of draining the reservoir to a safe level. It is unknown whether there is a low-level outlet and if it is functional.
- 3. Paragraph (3) (e) "All earthen embankments shall be protected from surface erosion by appropriate vegetation, or some other type of protective surface such as riprap, and shall be maintained in a safe condition." The slopes of the dam have trees/brush that need to be removed and replaced with a low growing grass. There is severe erosion in the plunge pool where the principal spillway pipe outlets. There needs to be erosion protection around the plunge pool area and along the waterline.
- 4. Paragraph (3) (f) "Each dam shall be capable of safely passing the fraction of flood developed from the PMP hydrograph depending on the sub classification of the dam." The spillway system has to be evaluated for adequacy of the system to be able to pass the required storm event.
- 5. Paragraph (3) (g) There is seepage/wet area at the toe of the dam that needs further investigation.
- 6. Paragraph (3) (j) "appropriate freeboard for wave action shall be considered..." The spillway system needs to be evaluated for compliance with this standard.
- 7. Paragraph (4) "Other design standards may be imposed as deemed appropriate..." The condition of the CMP through the dam is unknown and should be taken out of service.

The Rules require that you, an owner/operator of the dam, retain an experienced professional engineer recognized as an "Engineer of Record" to assist you with bringing the dam into compliance with the Act. Approved Engineer of Record lists are enclosed for your information. The dam may be brought into compliance by either addressing the noted deficiencies or by addressing the downstream hazard potential. The options are as follows:

- Upgrade the dam: Your Engineer of Record must perform a detailed investigation of the noted deficiencies and design remedial measures as necessary. After review and approval of the detailed investigation report, construction plans and specifications, and the schedule for any necessary improvements, we will recommend that the Director of the Division (Director) issue a Construction and Operation Permit for the dam. Once the remedial measures have been implemented, the dam will remain a permitted Category I structure and will be inspected on a regular basis to ensure that it is being maintained properly and remains in compliance. You will be required to perform your own routine inspections, maintain the dam and address any future deficiencies if they arise.
- Breach the dam: You will be required to fill out a breach application, and your Engineer of Record will be required to submit design plans for safely breaching the dam, such that it can no longer retain water. Once the breach plans have been approved and the dam has been breached, you will have no further responsibilities related to the Act and Rules.
- Modify the dam to remove the downstream flood risk: Your Engineer of Record must perform an extended dam failure flood study to identify all potential structures at risk downstream, such as homes, businesses, churches, etc., and submit design plans for the necessary modifications to the dam that would prevent flooding at these structures in the event of a dam failure. It should be noted that for classification purposes the Division typically only identifies one structure at risk. There may be additional structures in the dam failure flood zone. Once the flood study and design plans have been approved and the modifications implemented, the dam may be reclassified either Category II (low hazard) or exempt at the Director's discretion. A permit from the Division will no longer be required for operation of the dam. The classification may change if future development occurs in the dam failure flood zone.
- Remove or modify the downstream structure(s) at risk: Your Engineer of Record must perform an extended dam failure flood study to identify all potential structures at risk. All identified structures will have to be permanently removed from the dam failure flood zone or in some cases may be flood-proofed (design plans for flood-proofing will have to be reviewed and approved). Once the structures have been removed or adequately flood-proofed, the dam may be reclassified Category II at the Director's discretion, and a permit from the Division will no longer be required for operation of the dam. You should be aware that the classification may change if future development occurs in the dam failure flood zone.

Your engineer should be able to provide you with the feasibility of each option. All options require that your engineer inspect any necessary work as it is being performed. After the work is completed, your engineer must certify in writing that the work was performed in accordance with any approved plans and specifications. It is important that you do not attempt to modify the dam yourself. Often an improper repair attempt can do more harm than good, and the law requires that modifications to Category I dams be developed by an engineer and receive prior approval from the Division.

Please inform the Division's Safe Dams Program in writing at 4244 International Parkway, Suite 110, Atlanta, Georgia, 30354 before **January 15, 2013** with the name of the engineer you have retained to assist you with bringing the dam into compliance. It would be our recommendation that partial owners of the same dam work together to retain a common engineer. An engineering report must be submitted no later than **April 15, 2013**.

Margaret Phillips Lake Dam November 5, 2012 Page 3

The files of all dams, which are regulated by the Division, are public information. Representatives of engineering firms interested in remedial dam design work may see a copy of this letter in our files and contact you offering a proposal for the design work. The Division does not recommend any engineering firm to a dam owner. We suggest that you solicit proposals from several firms (a minimum of three) and then compare the experience and prices in making your selection.

If you have any questions about the contents of the enclosed report or your responsibilities with regard to the Act and Rules, please contact the Safe Dams Program at 404/362-2678, or write us and we will be glad to address your questions.

Sincerely,

Dallon Thomas Woosley, P.E.

Date Updated: 7/12/2016

Cost Estimate: \$5,520.98

Est. Project Length: 1 Week

Construction: Compete

Property Access:

Utilities:

Preliminary Eng:

Right Of Way:

Construction: Compete

Contractor: McCoy Grading

Const Start Date: 3/7/2016

Completion Date: 3/14/2016

Problem: Washout around an undersized 36 in. diameter corrugated metal pipe inlet

caused shoulder and pipe failure.

Propsed Solution: Replace the current pipe with a 42 in. reinforced concrete pipe and headwalls.

Percent Complete: 100

Current Status: Complete

Total Cost: \$46,257

Construction Photo

Post Construction Photo

Date Updated: 7/13/2016

Cost Estimate: \$75,000.00

Est. Project Length: 3 Weeks

Construction: In-House

Property Access: Complete

Utilities: Complete

Preliminary Eng: Complete

Right Of Way:

Construction: In-House

Contractor: Fayette County

Const Start Date: 5/27/2014

Completion Date: 9/14/2014

Problem: Road floods during the 2-year storm

event.

Propsed Solution: Install a 3'x6' concrete box culvert 60'

long under Brittany Way.

Percent Complete: 100

Current Status: Complete

Total Cost: \$67,432

Construction Photo

Post Construction Photo

Date Updated: 7/11/2016

Cost Estimate: \$24,671.06

Est. Project Length: 1 Week

Construction: Complete

Property Access:

Utilities:

Preliminary Eng:

Right Of Way:

Construction: Complete

Contractor: Brent Scarbrough and Company

Const Start Date: 12/24/2015

Completion Date: 12/31/2015

Problem: On 12/24/15, approximately 60 homes

within the Chanticleer Subdivision were without water and had no access to and from their homes when a 72-inch diameter corrugated metal pipe failed,

collapsing the road.

Propsed Solution: 1 - 72-inch RCP pipe with headwall

Percent Complete: 100

Current Status: Completed

Total Cost: \$101, 636
